

CSCE 190

Computing in the Modern World

Start the recording

Create a Github account

Github.com

Create a new account (or use an existing one if you want)

You need to choose a username. Mine is CSE-baileyr

You may use your personal or school email

The “CSE” part is NOT required (any username will be fine)

Pick something professional. This will become a career portfolio

My Github homepage is here: <https://github.com/CSE-baileyr>

Create a repo

The repo name must match your username EXACTLY

Username: CSE-baileyrt

Repo name: CSE-baileyrt.github.io

My repo URL is: <https://cse-baileyrt.github.io/>

Create index.html

In the Github repo, create a new file

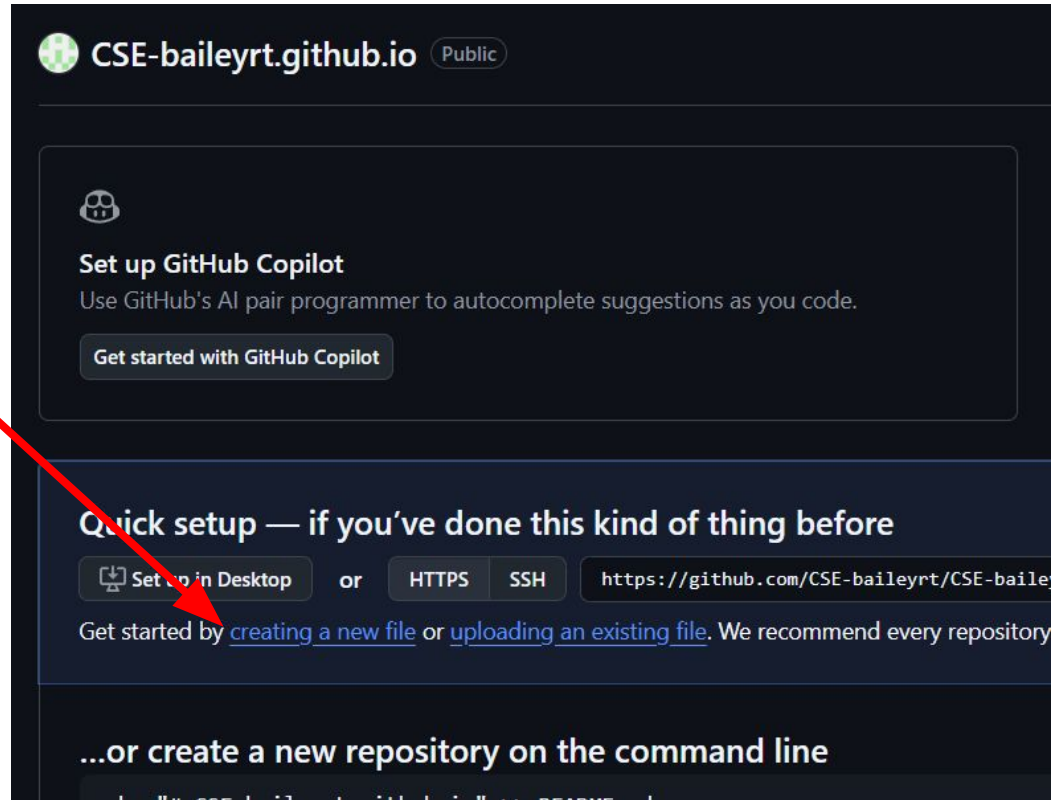

Name the file “index.html”

NOT “Index.html” (capital i)

NOT “index.htm” (file extension)

NOT “INDEX.html”

Leave the file empty

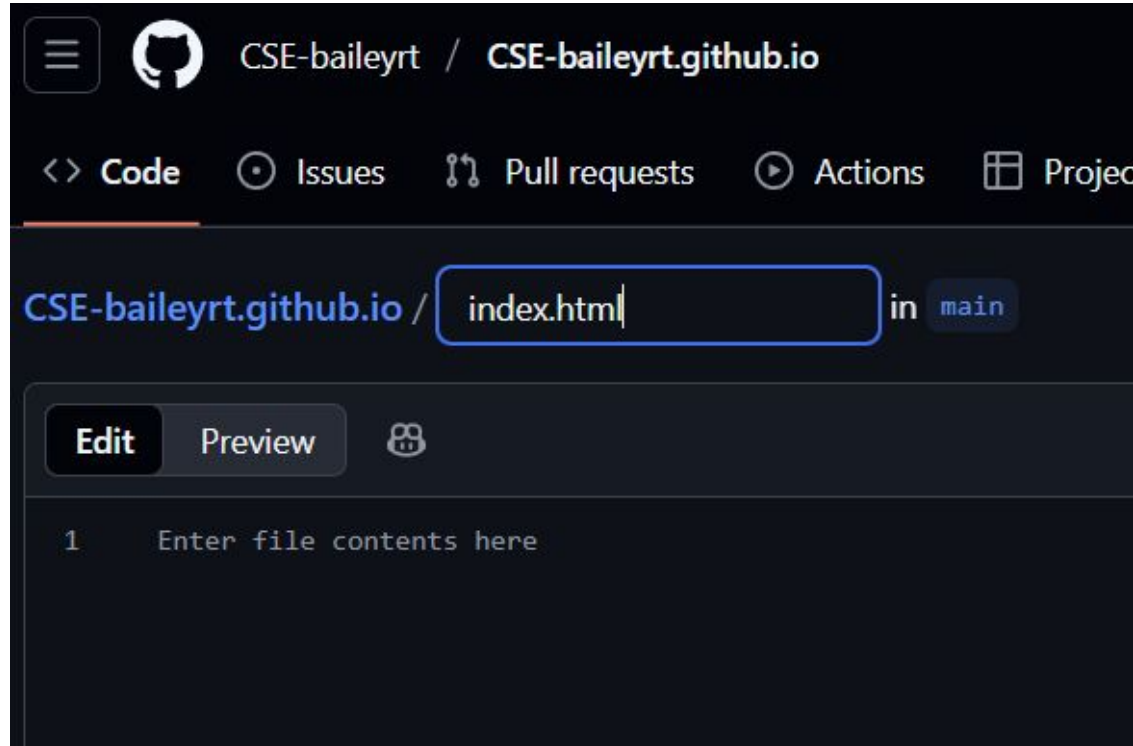

Commit the file

Leave the file empty

Click the green “Commit changes” button on the far right of the page

And then click the second “Commit changes” button that appears

Commit changes...

3 options for editing files on Github

We will demonstrate 3 methods:

Github dev (in-browser, best for Chromebook)

VS Code (text editor, best integration)

Manual mode (manage everything by hand)

Github Dev

Github dev

This is the simplest option

No need to install any applications or utilities, everything in browser

Downside: less functionality (ex: file management)

My repo URL is:

<https://github.com/CSE-baileyrt/CSE-baileyrt.github.io>

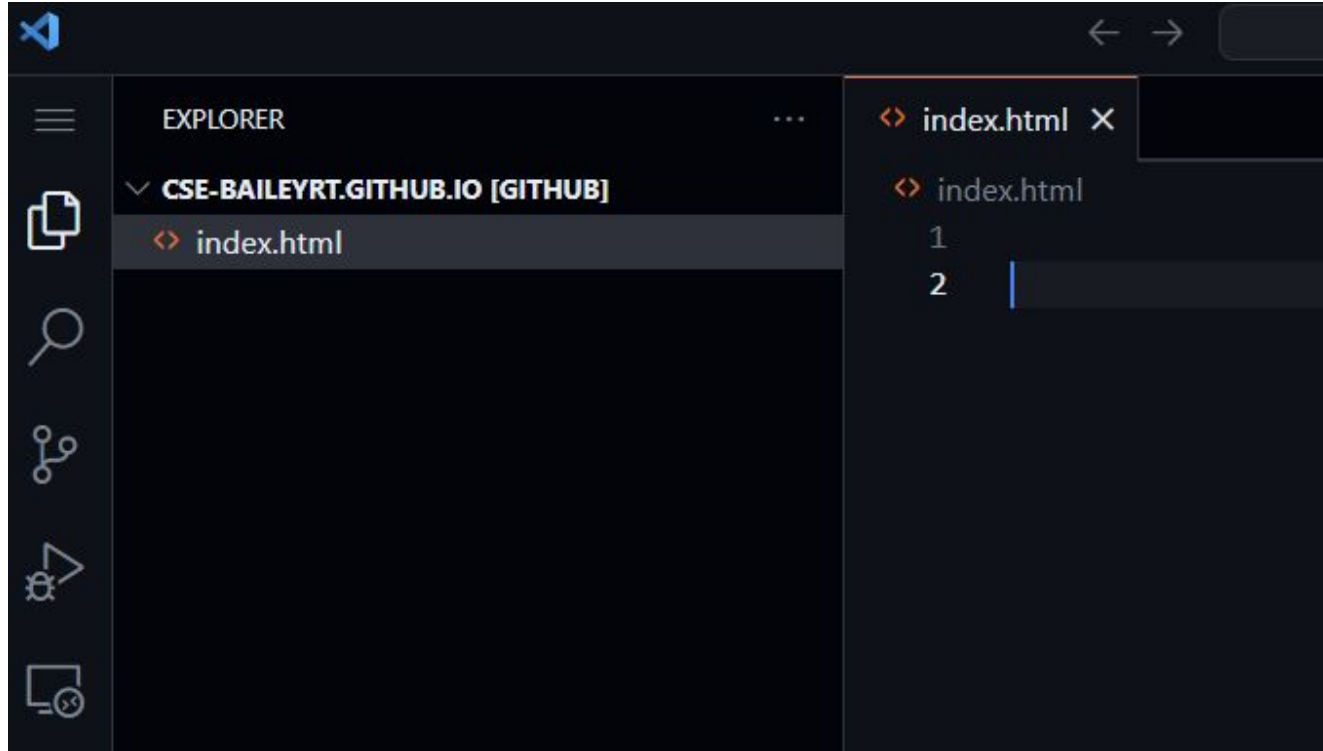

Alter that URL to:

<https://github.dev/CSE-baileyrt/CSE-baileyrt.github.io>

VS Code in browser

This is basically a lightweight version of VS Code, running in a browser window

Make changes

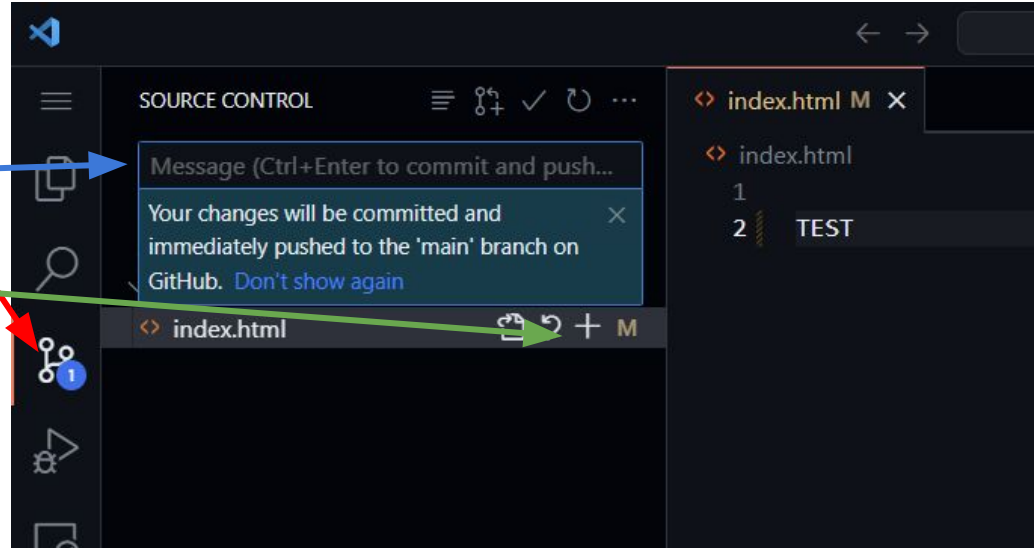

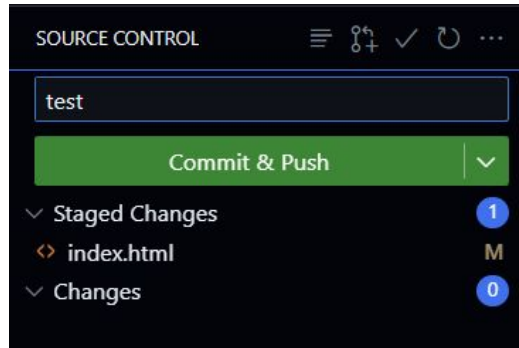

If you edit the file, an “M” appears by the name (modified)

Switch to the Source Control Explorer

Add a message (comment)

Hit the + sign

Click “Commit & Push”

VS Code

Install VS Code

Install Visual Studio Code

Open source, free

Made by Microsoft

Lightweight text editor

HTML support out of the box

Works on Windows, Mac, Linux, and powerful Chromebooks

<https://code.visualstudio.com/download>

Bind the repo to a local folder

High-level plan:

- Configure Git

- Associate a VS Code folder with the remote repo

- Clone the repository

- Create a new file and check in

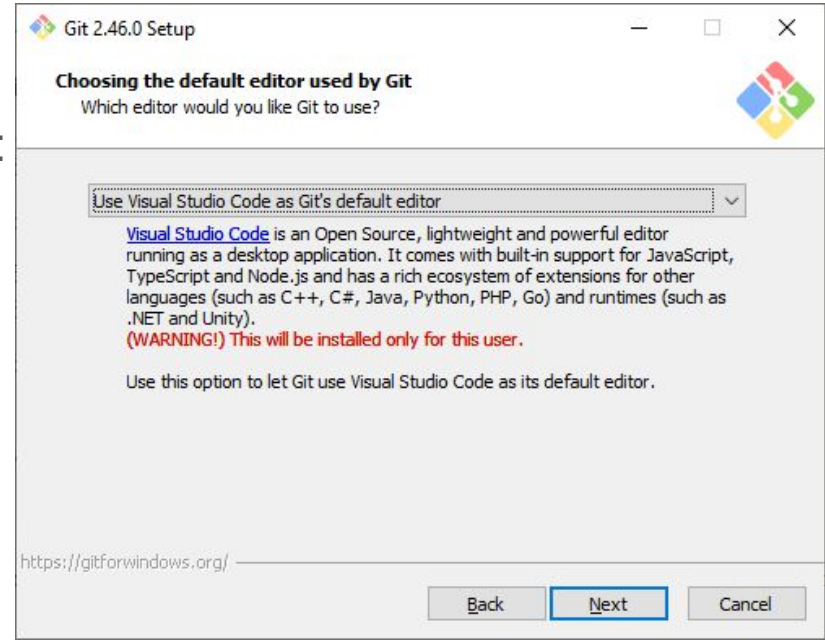

Install Git

<https://git-scm.com/downloads>

Download the Git client for your machine

Optional: set VS Code as the default editor:

(Everything else default)

Commit from VS Code to Github

First the setup: associate your username and email with Github (just once)

On your computer, search for “git bash” and run it

Run the following commands:

`git config --global user.name [your user name] (mine is CSE-baileyrt)`

`git config --global user.email [your email] (I'm using my school email)`

```
Bailey@BaileyBackup MINGW64 ~  
$ git config --global user.name CSE-baileyrt  
  
Bailey@BaileyBackup MINGW64 ~  
$ git config --global user.email baileyrt@cse.sc.edu  
  
Bailey@BaileyBackup MINGW64 ~  
$ |
```

Clone the repo

In VS Code, open the Source Control section

Click Initialize Repository and choose a local folder

At the top of Source Control, click the 3 dots and select Clone

Select Clone from Github

Select your repository

Select a local folder

Click Open to open that folder in VS Code

Manual upload

This is the backup option

If the other options break, this method nearly always works

It's very manual (downloading and uploading files)

Sometimes a manual upload will help overcome a bad sync or push

Upload files by hand

We created the repo and the index.html file

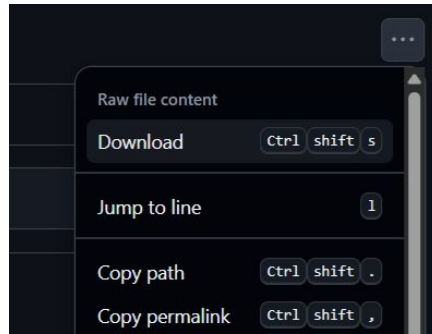

Now we want to make a change

First, we need to download the code to your machine

Go to the index.html file

<https://github.com/CSE-baileyrt/CSE-baileyrt.github.io/blob/main/index.html>

3 dots, download the “raw” file

Edit the file

Open the downloaded file

Make any edits, save

Go back to the repo

<https://github.com/CSE-baileyrt/CSE-baileyrt.github.io>

Click “Add file”, then “Upload files”

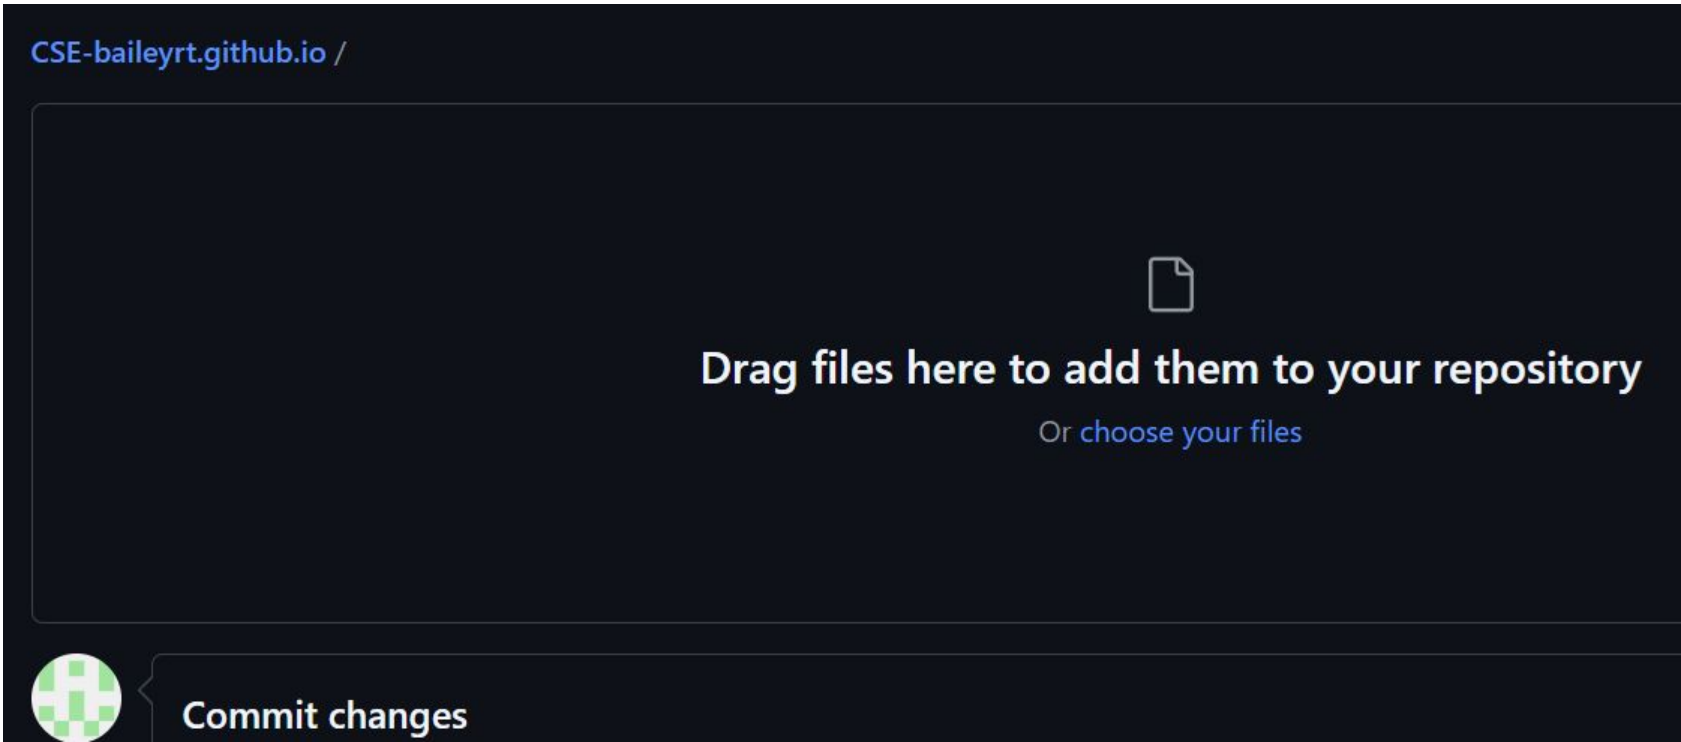

Drag and drop (next slide)

Add optional comments

Click green “Commit changes” button at the bottom

Drag and drop

Deposit files from your computer folder into this box

Options done, now HTML

Build a very simple web page

DOCTYPE

HTML

HEAD

TITLE

BODY

H1

Content of index.html*

```
<!DOCTYPE html>
```

```
<html>
```

```
  <head>
```

```
    <title>CSCE 190: [your name]</title>
```

```
  </head>
```

```
  <body>
```

```
    <h1>[your name]</h1>
```

```
  </body>
```

```
</html>
```

While that commits...

In Source Control, enter a message and click “Commit” then “Sync”

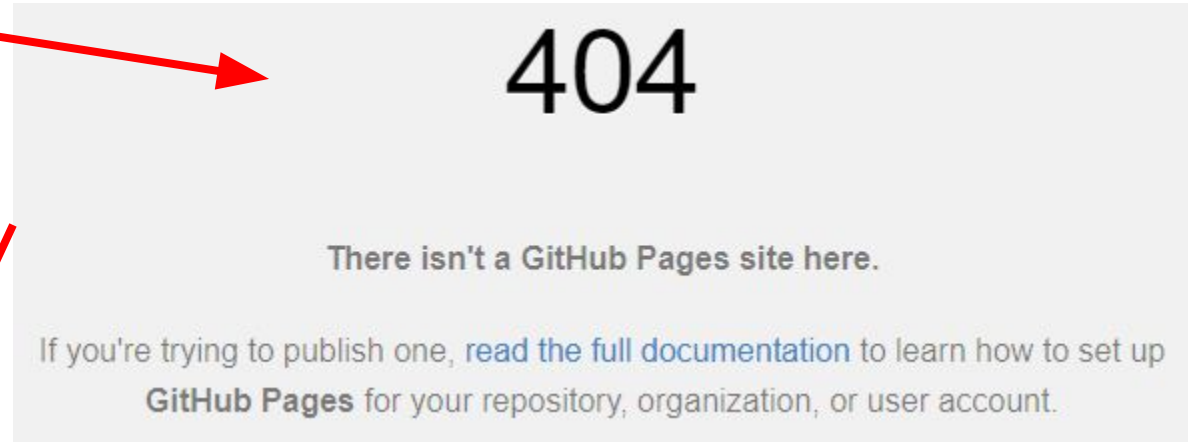

Listen to me ramble about HTML and VS Code

Open the page [username].github.io and refresh until the 404 goes away

<https://cse-baileyrt.github.io/>

[your name]

HTML tags

Start tag matches to end tag

Some HTML elements are single-line or self-contained

Some items are visible (in <body>) and some are not (in <head>)

Element types:

Heading, anchor, span, div, section, paragraph

Table, bulleted (unordered) list, numbered (ordered) list

Image, iframe, code, form

Button, bold/strong/em, italics, break, label, input, textarea

HTML attributes

Properties about the element

Placement, design, behavior, purpose

Common attributes:

Image source (src), anchor pointer (href), div class or style, image alt

Syntax:

```
<tag attribute="value">element contents</tag>
```

Check your website:
[https://\[yourUserName\].github.io/](https://[yourUserName].github.io/)

Congratulations, you
just began your
journey to creating a
code portfolio and a
public website

Assignment

Create a Github account

Create a github.io repository on Github

Connect to your repo and Commit a change

Using VS Code, the Github website, Github dev, etc.

Test your github.io link

Submit your github.io link to Blackboard

Use my Github as a reference, if needed

Repo: <https://github.com/CSE-baileyrt/CSE-baileyrt.github.io>

Website: <https://cse-baileyrt.github.io/>

References

Katelyn Wyandt created the HTML content. Kudos to her!
